### Abstract

*This article aims to understand the domains and uses of the various conceptual frameworks of contagion, its modalities and effects, in its different acceptations and historical contexts, as an expression of the process of interdependence between the stances and the different viewpoints of diverse actors involved with multiple scientific, moral, social and political challenges. Another objective focuses on understanding the process of collective management of contagion, disease and health, in which prevention is a critical element of its objectives and justifications, its discursive order and its practical activities.*

## The Application of the Multivariate GARCH Models on the BRICS Exchange Rates

### Abstract

*The study investigated the BRICS exchange rate volatility using the Multivariate GARCH models. The study used the monthly time series data for the period January 2008 to January 2018. The BEKK-GARCH model revealed that all the variables were found to be statistically significant. The diagonal parameters estimates showed that only Russia and South Africa were statistically significant. This implied that the conditional variance of Russia and South Africa's exchange rates are affected by their own past conditional volatility and other BRICS exchange rates past conditional volatility. The BEKK-GARCH model also revealed that there is a bidirectional volatility transmission between Russia and South Africa. The results from the DCC-GARCH model revealed that Brazil, China, Russia and South Africa had the highest volatility persistence and India has the least volatility persistence. All the BRICS exchange rates show that the fitted residuals are not normally distributed except for Russia. The recommendations for future studies were articulated.*
