body of water plays an essential role in the transmission of leptospirosis . Design and methods: This study aims to determine the risk factors and Leptospira bacteria's presence in water bodies in Boyolali District . This research is descriptive research with a survey method using a cross-sectional design and an analytical study using an observational method with a case-control approach. The sample was 100 water samples from wells, rivers, and paddy fields in endemic and non-endemic areas of leptospirosis . This study's population was 34 people with leptospirosis in Boyolali Regency in January 2017-August 2018. Results: There was a significant relationship between leptospirosis incidence in the Boyolali Regency with garbage, the pet presence , a history of injuries, and field activity. Leptospira bacteria are found in rivers (18.18%) and rice fields (6.67%), while in sub-districts with cases occur almost every year. Leptospira are found in wells (18.18%) and rice fields (6.67%). Conclusions: People should pay more attention to home sanitation and the surrounding environment to avoid leptospirosis . comme. © the Author(s), 2021.

Various countries in Europe have different strategies for promoting care solutions for dementia challenges. The different approaches of Austria, Belgium, Czechia, Denmark, Finland, Germany, Gibraltar, Ireland, Israel, Malta, Nederland, Norway, Sweden and the United Kingdom (Scotland and Wales) were investigated. Dementia has a significant social, psychological and economic impact on the individual, family and society. As the disease progresses dementia sufferers become increasingly dependent. As many dementia sufferers are at home during the initial stages, the physical, emotional, and social demands of the dementia sufferers are often covered by informal caregivers. This study,

therefore, aims to investigate the integration of psychosocial interventions for comprehensive care pertaining to informal caregivers of people with dementia in Europe. Furthermore, the study will highlight how implementation of technologies might enable psychosocial support of informal caregivers. The data is based on 15 national dementia strategies from various European countries. Data was based on preexisting coding systems with the predefined keywords and analyzed by qualitative content analysis by four of the authors. Our results show that psychosocial support is provided in various modalities and that informal caregivers need to be supported by a psychosocial approach. Due to this need the national dementia strategies should include measures to reduce the emotional burden of informal caregivers. Psychosocial support provided to informal caregivers in a comprehensive and systematic way is likely to enable informal caregivers to handle the emotional, cognitive, and behavioral consequences of the disease and its treatment, while helping to maintain their work-life balance. © the Author(s), 2021.

of overweight and obesity among studied population. Design and Methods: This Persian Cohort Study is a population-based study of 10,000 men and women, aged 35-70 years in northwest of Iran. Anthropometric parameters such as height, weight, waist circumference and hip circumference were measured by interviewers. Body Mass Index (BMI) and waist-to-hip ratio (WHR) were used to assess the overweight and obesity. Results: The mean age of all participants was 49.1±8.7 and 56.1% of them were female. The mean height of participants was 162.5±9.4 kg in range 126-196 and the mean weight of them was 78.5±13.1 cm in range 40-164. According to BMI, 42.7% of all participants had overweight and 45% had obesity. According to the WHR, 71.8% of male and 97.9% of female had high WHR (abdominal obesity). Conclusions: Results showed that the rate of overweight and obesity in studied people was more than country rate. So program-ing for raising their Quality of Life and life style and also change their poor nutritional habits is essential in area healthy people. © the Author(s), 2021.
