Welcome To U-GO Healthy Forum 2020

The growth rate of the global halal industry has increased in recent years, from 7.5% in 2015 to more than 8% in 2016 and is expected to continue to increase in 2017 and beyond. Indonesia in particular has great potential in the development of the halal industry sector because of the percentage of Indonesia's population which constitutes 12.7% of the world's Muslim population. The large potential of Indonesia in the halal industry sector can support national economic growth. The market for halal industry in Indonesia, especially the food, travel, fashion, medicines and cosmetics sectors has reached around 11% of the global market in 2016.

Behind the development of the halal industry globally, there are challenges especially in the health sector. The fact about guaranteeing halal products on drugs is still very alarming because the data from LPPOM MUI shows that out of 30 thousand types of drugs registered with BPPOM and circulating in the community, only 34 drugs are halal certified. In the food sector, data shows that Indonesia is the highest spending country for halal food compared to other countries in the world with a total expenditure of 170 billion US dollars. In the field of Occupational Health and Safety (OHS) is inseparable in the development of human resources in the halal industry. The security and quality of the halal industry are also closely related to the quality of human resources and the nation's competitiveness.

The Challenge of the Development of Halal Industry globally and the readiness of
Indonesian health workers to deal with it

Abstract

The research aims to create a proposed waqf based food barn for food security through cash waqf organized with Global Wakaf (GW)-Aksi Cepat Tanggap (ACT) Indonesia food security is the need of every human being on this earth. the unity of nations formulates that each nation will be able to develop and be sustainable if food is guaranteed. Indonesian agrarian countries have the opportunity to create food security through agriculture in collaboration with many philanthropic agencies. global waqf-ACT established Food Waqf Barns to help farmers and residents affected by the disaster in Jipang, Blora, Indonesia. This paper aims to determine the mechanism of Waqf Food Barn production using qualitative methods consisting of interviews, observations and documents. and the conclusion of this study is that the first support of LPW comes from cash waqf collected from waqifs, LPW has two programs, namely the provision of superior seeds, fertilizer and purchase of farmers' crops.

Abstract

Work noise and stress do not only appear in industrial areas but also in public places like the Bus Station. One of the risk factors at the bus station is noise and work stress. This study aims to determine the relationship between traffic noise and work stress with blood pressure. research methods with observational analytic and cross sectional approaches. The population is 95 Tirtonadi Bus Station field workers. Sampling by simple random sampling and get 50 respondents as samples. The instrument used a Sound Level Meter to measure noise, Job Stress Questionnaire based on from Minister of Manpower regulations No. 5 of 2018 to assess work stress and Sphygmomanometer Aneroids to measure blood pressure. Independent and dependent variables are calculated by the Spearman rank test. Test results show an intermediate p-value traffic noise with blood pressure of 0.813 and 0.715. work stress with systolic and diastolic blood pressure shows p-values of 0.037 and 0.047. Conclusions There is no significant relationship between noise and blood pressure. There is a relationship between work stress and blood pressure.

Abstract

Type 2 diabetes mellitus is an incurable but manageable disease. The ability to control blood sugar levels in these patients requires collaboration between health care providers, especially doctors who prescribe drugs, and patients as someone whose health outcome will be affected. The results of cooperation between the two parties are shown by the patient's compliance in taking daily medication. The purpose of this paper is to gain a theoretical understanding of the concept of adherence in medication (taking daily medication in type 2 Diabetes Mellitus patients). Compliance in taking daily medication is the behavior to follow the suggestions or procedures from doctors about the use of drugs, which was preceded by the consultation process between patients and doctors as health service providers. Some aspects used to measure compliance in taking daily medications are frequency, number of pills/other drugs, continuity, metabolism in the body, biological aspects in the blood, and physiological changes in the body. While the determinants of the emergence of adherence in taking daily drugs include: patient perceptions and behavior, interactions between patients and doctors and medical communication between the two parties, policies and practices of treatment in the public made by the authorities and various interventions carried out so that compliance in consuming drugs occurs. The results of this paper are expected to be an understanding for those who are dealing with type 2 Diabe
