**Catatan Penilaian artikel oleh Reviewer :**

- Kesesuaian dan kelengkapan unsur isi jurnal:**  
Konten jurnal cukup baik sesuai dengan ketentuan yang berlaku.
- Ruang lingkup dan kedalaman pembahasan:**  
Substansi artikel sesuai dengan ruang lingkup jurnal yaitu bidang komputasi statistik. Kedalaman pembahasan cukup baik (sebagian besar rujukannya dilibatkan dalam proses pembahasan hasil). Artikel yang dipublikasikan membahas tentang pemodelan machine learning.
- Kecukupan dan kemutakhiran data/informasi dan metodologi :**  
Dalam studi tersebut, telah diperoleh sekumpulan informasi yang didukung oleh metodologi yang tepat dan didukung oleh referensi yang terbaru.
- Kelengkapan unsur dan kualitas terbitan:**  
Jurnal ini tergolong J. Internasional (Editor board lebih dari 4 negara, Kontributor lebih dari 2 negara, ISSN: 19275307, terindeks di Copernicus; proses editorial yang cukup baik. Artikel tidak terindikasi plagiasi, dengan hasil similarity index 13%, dan sesuai bidang ilmu pengusul (statistika terapan)..

**Aims and Scope**

Journal of mathematical and computational science (JMCS) is a peer-reviewed open access international journal, which is aimed to provide a publication forum for important research in different areas covering all aspects of mathematical and computational science, such as numerical analysis, optimization, linear and nonlinear programming, theory of computation, control theory, theory of algorithms, computational logic, applied combinatorics, coding theory, cryptographics, fuzzy theory, differential equations, algebra and number theory. This journal will accept high quality articles containing original research results and survey articles of exceptional merit.

ISSN: 1927-5307

Editorial Office: [jmcs@scik.org](mailto:jmcs@scik.org)

**Editorial Policy**

Papers submitted for publication in the journal must be correct, original, and nontrivial.

**Copyright**

By submitting a manuscript, the author acknowledges that:

It has not been previously published elsewhere, is original and has been written by the stated authors.

The article is not currently being considered for publication by any other journal and will not be submitted for such review while under review by this journal.

All authors have read the manuscript and agree to publish it.

The authors declare that there is no conflict of interests.

**Open Access**

Journal of Mathematical and Computational Science is an open access journal, and all articles are distributed under the [Creative Commons Attribution License](#), which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

**Abstract:** In this paper, we formulate a deterministic mathematical model to describe the transmission dynamics of typhoid fever by incorporating some control strategies. In order to study the impact of these control strategies on the dynamics of typhoid fever, the model captures vaccination and educational campaign as control variables. We show that the model is mathematically and epidemiologically well positioned in a biologically feasible region in human populations. We carry out a detailed analysis to determine the basic reproduction number  $R_0$  necessary for the control of the disease. The optimal control strategies are used to minimize the infected carriers and infected individuals and the adverse side effects of one or more of the control strategies. We derive a control problem and the conditions for optimal control of the disease using Pontryagin's Maximum Principle and it was shown that an optimal control exists for the proposed model. The optimality system is solved numerically, the numerical simulation of the model shows

## ON INTERVAL VALUED FUZZY ALMOST $(m, n)$ -BI-IDEAL IN SEMIGROUPS

THITI GAKETEM\*

Department of Mathematics, School of Science, University of Phayao, Phayao 56000, Thailand

Copyright © 2021 the author(s). This is an open access article distributed under the Creative Commons Attribution License, which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

**Abstract.** In this paper, we study the concept of an interval valued fuzzy almost  $(m, n)$ -bi-ideals. We investigate properties of an interval valued fuzzy almost  $(m, n)$ -bi-ideal in semigroups.

**Keywords:** almost  $(m, n)$ -bi-ideal; bi-ideal; interval valued fuzzy almost  $(m, n)$ -bi-ideal.

**2010 AMS Subject Classification:** 03E72, 18B40.

### 1. INTRODUCTION

The theory of fuzzy set was presented in 1965 by Zadeh [12]. The theory of fuzzy semigroups contained by Kuroki in 1979 [8]. Later the theory of interval valued fuzzy sets was introduced in 1975 by Zadeh [13], as a generalization of the notion of fuzzy sets. Interval valued fuzzy sets have various applications in several areas like medical science [3], image processing [2], decision making [14], etc. In 2006, Narayanan and Manikantan [7] developed the theory of interval valued fuzzy subsemigroup and studied types interval valued fuzzy ideals in semigroups. In 1961, Lajos [5] studied the concepts of  $(m, n)$ -ideals in semigroups which generalized of ideals of semigroups. The research of  $(m, n)$ -ideals of semigroups has interested many such as Akram et al. [1], N. Yaqoob and M. Aslam [10] and many others. In 2020 Ahsan et al. [6] extended

**Abstract.** In this study, we propose a nonlinear autoregressive network with exogenous inputs (NARX) model with two deterministic seasonal dummy approaches, that is binary dummy variables and sine-cosine pairs. For significant lag is selected using a stepwise AIC method, including a deterministic seasonal dummy. While the number of neurons in the hidden layer is conducted by trial and error method on one to five neurons. The NARX model is trained using five types of algorithms and a tangent hyperbolic activation function. Each algorithm is compared on all approaches to see the speed of convergence and forecasting accuracy. In addition, time series data is performed using data without and with the first differencing process. The results of the case study show that the best approach to the NARX model is to use binary dummy variables and data with the first differencing process. On the other hand, the GRPROP algorithm shows the least computation time, the fastest training process steps, and forecasting accuracy with the best MAPE value. Overall, the GRPROP algorithm is the best training algorithm in this case. However, the GRPROP algorithm on the variation of its parameters shows it is not stable. While the RPROP algorithm for parameter variations shows a better speed and stability of convergence than backpropagation and GRPROP. The backpropagation algorithm occasionally outperforms GRPROP on its parameter variations.

**Keywords:** time series; with and without first differencing; seasonal dummy; stepwise; backpropagation; RPROP; GRPROP; NARX model.

**2010 AMS Subject Classification:** 37M10.

## MATHEMATICAL MODELLING OF THE TRANSMISSION DYNAMICS OF HEPATITIS B VIRUS IN THE PRESENCE OF IMPERFECT VACCINATION

PAUL CHATAA<sup>1,\*</sup>, FARAI NYABADZA<sup>2</sup>, SAMUEL M. NAANDAM<sup>1</sup>

<sup>1</sup>Department of Mathematics, University of Cape Coast, Cape Coast, 00233, Ghana

<sup>2</sup>Department of Mathematics and Applied Mathematics, University of Johannesburg,  
Auckland Park, 2006, South Africa

Copyright © 2021 the author(s). This is an open access article distributed under the Creative Commons Attribution License, which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

**Abstract.** Hepatitis B infection remains a global problem since the 1990s and the reasons for which disease is still in existence remain poorly understood. However, understanding the important role played by vaccination in the transmission dynamics of Hepatitis B virus is critical to its control and management. In this paper, an epidemiological model is proposed to model the spread of the Hepatitis B virus disease in the presence of imperfect vaccination. The basic reproduction number,  $\mathbb{R}_0$  and the equilibria of the model are determined and the stabilities of the equilibria determined. It is shown that the disease-free equilibrium point is both locally and globally asymptotically stable when  $\mathbb{R}_0 < 1$  while the endemic equilibrium point is proved to be locally asymptotically stable when  $\mathbb{R}_0 > 1$ . The model is also shown to exhibit a backward bifurcation phenomenon. Numerical simulations are carried out and it is observed that increasing both the vaccination and treatment rates reduces the populations of both the acutely infected and chronic carriers which eventually leads to the containment of the disease. We conclude that the combination of both vaccination and treatment with the use of a vaccine with a high efficacy is essential in the control of Hepatitis B virus disease.

**Keywords:** Hepatitis B virus (HBV); imperfect vaccination; treatment; simulations.

**2010 AMS Subject Classification:** 37N25.
