Catatan Penilaian Artikel oleh Reviewer:

1. Tentang kelengkapan dan kesesuaian unsur:

Unsur-unsur artikel jurnal ini memuat judul, abstrak, introduction, method, results, discussion, conclusion, dan reference list. Unsur tersebut lazim ada pada artikel jurnal internasional. Meskipun demikian, artikel ini hanya terdiri dari 4 halaman.

2. Tentang ruang lingkup dan kedalaman pembahasan:

Artikel ini membahas tentang korelasi peran kakak/ nenek terhadap subjective well-being kakak/ nenek tersebut yang memiliki cucu penderita Autism Spectrum Disorder (ASD). Hasilnya menunjukkan bahwa hipotesis diterima, yaitu adanya korelasi peran kakak/nenek dengan SWB mereka dan peran nenek/ kakek dalam merawat cucu penderita ASD ditunjukkan melalui perilaku merawat cucu ketika orangtua anak tersebut tidak dirumah, membantu biaya terapi cucu dan merawatnya ketika sakit.

3. Kecukupan dan kemutakhiran data/informasi dan metodologi:

Daftar pustaka dalam artikel ini memuat 36 referensi, dan 80% diantaranya merupakan terbitan 10 tahun terakhir. Dari perspektif jumlah, 36 referensi yang digunakan sebagai sumber pustaka tergolong cukup untuk mendukung sebuah artikel yang komprehensif.

4. Kelengkapan unsur kualitas penerbit:

Kualitas dan kelengkapan unsur penerbit prosiding tergolong cukup memadai. Kualitas cetak juga cukup memadai.

5. **Indikasi plagiasi:**

Orisinalitas artikel ini tergolong cukup baik, yang ditunjukkan dengan hasil Turnitin Similarity Index sebesar 17%. Hal ini juga memberikan gambaran bahwa tidak terdapat tanda plagiarisme dalam artikel ini.

6. **Kesesuaian bidang ilmu:**

Artikel ini memuat tema penelitian yang sejalan dengan bidang ilmu pengusul, yaitu psikologi perkembangan.

Abstract**Author keywords****SciVal Topics****Metrics****Abstract**

Objective: The purpose of this study was to explore the family roles and psychological well-being of grandparents who are caregivers of grandchildren with autism spectrum disorders. **Method:** The study used quantitative methods with a correlational design. A self-administered questionnaire was used as an instrument to measure the variables of psychological wellbeing and the grandparenting role. This research involved 108 grandparents from Semarang, Jepara and Kendal, obtained through a quota-purposive sampling technique. Quantitative data analysis was based on simple regression analysis. **Results:** The study results showed $r_{xy} = 0.397$; $P = .000$ ($P < .05$), which indicates a positive and significant correlation between the role played by grandparents and their psychological well-being. **Conclusions:** The test results indicate a significant correlation between the roles of grandparents and their psychological well-being. The greater the role played by grandparents, the higher psychological well-being they experienced, and vice versa. Grandparents play an important role in families where there is a child with autism; they take care of the child

1st International Nursing Scholars Congress

Important Information

Dear Participant,

Recognizing the opening of **The 1st International Nursing Congress 2016** will begin in four days ahead which on November 15th; we'd like to send you this note as a reminder to **upload your manuscript immediately before November 12, 2016 at 23.55 PM**. We do regret to notify that participants who do not send their presentations until the deadline specified above, their manuscript will not be processed into journal or proceeding.

For Oral Presenters, we also hope that you could send your presentation (**Power Point is preferred**) **no later than November 13th, 2016 at 23.55 PM** to **insc@ui.ac.id**.

We are sincerely looking forward to receive the manuscript and see you in the conference.

Important Dates

18th July – 25th September 2016

: Abstract Submission

7 th October 2016	: Abstract Acceptance Notification
7 th November 2016	: Full Paper Submission Deadline

Abstract

Objective

The objective of this study is to identify the need for basic first aid knowledge and skills among adolescents.

Method

A cross-sectional study using multistage sampling was conducted among 375 secondary school students in Kuantan, Pahang, Malaysia. The survey was adapted from a Hong Kong Red Cross survey. A back to back translation of this instrument was carried out by two bilingual medical experts with Cronbach's alpha 0.8. The data were analyzed using SPSS (Statistical Package for the Social Sciences) in terms of descriptive analysis, and an independent *t*-test and chi-square test were carried out.

Results

There were 149 respondents from the lower form (grade level) and 226 respondents from the upper form. The majority of respondents (81.6%) were Malay. An independent t-test revealed a significant association between knowledge and attitude, as students who scored higher on first aid questions showed a more positive attitude towards first aid (1.475%). There were also significant associations between race and experience learning first aid.

Conclusions

Adolescents receive minimal first aid education. Thus, there is an urgent need to educate adolescents more in first aid to promote a safer community and to prevent any further injuries.

Abstract

Objective

This quasi-experimental, pre-/post-test study aimed to examine the effect of a community-based spiritual life review program on the resilience of elders residing in a disaster-prone area.

Method

Fifty-two participants who met the inclusion criteria were recruited from three villages in the Kutaraja sub-district in Banda Aceh, Indonesia. The participants were randomly assigned to an experimental group and a control group. The participants' names were listed and then randomly selected by a random number generator. The experimental group underwent a community-based spiritual life review program, which included a review of their spiritual lives, the appreciation of feelings, affirmation by the religious leader, a reevaluation of their lives, and a reconstruction of their lives to recognize their memories and present feelings.

Results

The elderly resilience scores were evaluated four weeks after the program was implemented. The control group received the same program after the study was finished. The participants in the experimental group significantly improved their resilience levels after completing the program ($p < .05$). There was a slight increase in the resilience scores from the pre-test to the post-test in the experimental group compared with the control group ($p < .05$).

Abstract

Objective

Substance misuse tends to be higher among adolescents. This study explored the experience of substance misuse during adolescence.

Method

This qualitative study employed a descriptive phenomenological approach. A purposive sampling was adopted to involve 8 former drug users. Data were analyzed using Collaizi's method.

Results

This study generated the following themes: 1) smoking as an initial exposure to substance use; 2) substance use is aimed to explore self-identity; 3) lack of information and education about substance and drug use in the family and community; 4) the quality of family relationships influencing substance misuse, and 5) stigmas related to substance abuse.

Conclusions

Smoking precedes other substance use among adolescents. To be socially accepted, adolescents tend to take risky decisions. Inadequate knowledge of drugs and poor family relationships can contribute to substance abuse. Nevertheless, inadequate familial or community support to encourage drugs users in rehabilitative programs is also problematic. Moreover, drugs users are often stigmatized and socially isolated even after becoming clean.

Does open or closed endotracheal suction affect the incidence of ventilator associated pneumonia in the intensive care unit? A systematic review

Denissa Faradita Aryani^a , Judith Tanner^b

[Get rights and content](#)

Abstract

Objective

To compare closed and open endotracheal suction system in relation to ventilator-associated pneumonia in adult intensive care unit patients

Method

Systematic review.

Results

Of the 18 eligible studies identified through the search strategy, only 5 studies were included in the review. The two endotracheal suction systems show no differences in the incidence of ventilator-associated pneumonia (5 trials: odds ratio [OR], 0.92; Mantel-Haenszel [M-H], fixed; 95% confidence interval [95%CI], 0.72–1.18) or mortality rates (3 trials: OR, 0.89; M-H, fixed; 95%CI, 0.62–1.28).

Conclusions

Results from 5 studies showed that suctioning with either closed or open endotra-cheal suction did not have an effect on the incidence of ventilator-associated-pneumonia or mortality rates. Therefore, more rigorous and large-scale research is needed for further evaluation.
