Catatan Penilaian artikel oleh Reviewer:

1. Kesesuaian dan kelengkapan unsur isi jurnal:

Isi unsur jurnal lengkap sesuai yang dipersyaratkan oleh jurnal internasional. Yang terdiri dari judul, abstrak, dan metodologi, hasil dan pembahasan, kesimpulan dan ucapan terimakasih serta daftar Pustaka. Dengan similarity sangat baik (19%).

2. Ruang lingkup dan kedalaman pembahasan:

Isi artikel meliputi tentang fabrikasi lapis tipis CuInS₂ dan Cu(In, Ga)S₂ dengan spray pyrolysis dan sifat fotovoltaik dan fotoelektrokimianya. Pembahasannya cukup mendalam dengan menggunakan instrumentasi pengujian yg sangat baik. Pembahasannya disertai referensi yang menguatkan data yang diperoleh.

3. Kecukupan dan kemutakhiran data/informasi dan metodologi:

Data/informasi yang disampaikan cukup baik dan mutakhir dan metodologinya disampaikan secara detil namun ada yang tidak semua dicantumkan pada penelitian ini. Referensi yang digunakan up to date (40% referensi kurang dari 5 tahun artikel terbit)

4. Kelengkapan unsur dan kualitas terbitan:

Unsur artikel lengkap, kualitas jurnal sangat bagus dan jurnal Q1 bidang kimia.

Artikel ini terbit waktu pengusul masih S3 (2012-2015).

Catatan Penilaian artikel oleh Reviewer :

1. Kesesuaian dan kelengkapan unsur isi jurnal:

Artikel sesuai dengan kepakaran penulis, lengkap unsur dalam isi jurnal (4) yaitu judul, abstrak (berisi latar belakang, metode dan hasil), Grafik dan tabel disitasi dan dibahas, penulisan sesuai dengan panduan penulisan jurnal Catalys Science & Tehnology. Tata penulisan terjadi dengan baik. (4)

2. Ruang lingkup dan kedalaman pembahasan:

Cukup mendalam dalam membahas fabrikasi semikonduktor untuk solar cell dan karakterisasinya dengan instrumen yang lengkap XRD, SEM, EDX, serta karakterisa photocurrent property nya. (12)

3. Kecukupan dan kemutahiran data/informasi dan metodologi:

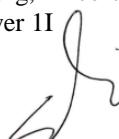

Referensi yang digunakan menunjang pembahasan dan metodologi yang digunakan uptodate (40 % referensi dengan tahun terbit sebelum 5 tahun artikel ini terbit) (12)

4. Kelengkapan unsur dan kualitas terbitan:

Secara umum kelengkapan unsur artikel lengkap. Kualitas jurnal Catalys Science & Tehnology yang diteerbitkan oleh RS Publishing sangat bagus dan konsisten web of Sciene peringkat Q1 (Bidang Kimia) SJR 1,744 (2013). (12)
Catatan: Artkel ini terbit ketika pengusul sekolah S3 (2012-2015) . Turnitin 19%.

Research Center for Solar Energy Chemistry, Osaka University, 1-3 Machikaneyama, Toyonaka 560-8531, Japan

Abstract

View references (29)

Polycrystalline CuInS₂ chalcopyrite thin films were formed on a Mo-coated glass substrate by annealing of spray deposited precursor films in a sulfur atmosphere. Structural and photoelectrochemical analyses of CuInS₂ films obtained by annealing at 500 °C and 600°C revealed that a well-defined crystalline film was obtained by the 600°C annealing. Owing to these favorable properties, the solar cell with an Al:ZnO/CdS/CIS/Mo/ glass structure based on the 600°C annealed CuInS₂ film showed higher conversion efficiency than that obtained on the cell derived from the 500°C annealed CuInS₂. Partial incorporation of Ga in the CuInS₂ film with a Ga/In ratio of ca. 0.2 to form a Cu(In,Ga)S₂ mixed crystal without any reduction of photoelectrochemical properties can be achieved by introduction of a Ga source in the sprayed solution. As a result, the solar cell based on the 600°C annealed Cu(In,Ga)S₂ film showed the best conversion efficiency (5.8%) of the present sprayed chalcopyrite films. By introduction of a CdS thin layer followed by loading Pt deposits, moreover, the 600°C annealed Cu(In,Ga)S₂ film worked as a photocathode for photoelectrochemical water splitting with applied bias potential of >0.65 V. © 2013 The Royal Society of Chemistry.

Promotional effect of indium on Cu/SiO₂ catalysts for the hydrogenation of dimethyl oxalate to ethylene glycol

Yuxi Xu, Lingxin Kong, Huijiang Huang, Hui Wang, Xiaofei Wang, Shengping Wang, Yujun Zhao and Xinbin Ma

CuIn/SiO₂ with 1.0 wt% indium shows the best catalytic performance for DMO hydrogenation to EG. The synergistic effect of Cu⁰–Cu⁺–CuIn alloy in activating H₂ molecules and carbonyl bonds is elucidated.

Supporting our community through Covid-19

While our publishing services are running as usual, we also know that this is a very challenging time for everyone, for many different reasons. If any aspect of the publishing process is worrying you – for example you think you may struggle to meet a pre-determined deadline – please let us know, and we will work out an answer together.

Setting up remote access to RSC content

You can find details about how to access information remotely in this [step-by-step guide](#) ([/covid-19-response/publishing-remote-access/](#)). The guide will also help if for any reason you have difficulty accessing the content you want.

Impact factor: 5.721*

Publishing frequency: 24 issues per year

Editor-in-chief: Javier Pérez-Ramírez

Scope

Catalysis Science & Technology is a leading international journal for the publication of the highest impact articles reporting cutting-edge developments across the catalysis science community. The journal places equal focus on publications from the heterogeneous, homogeneous, organocatalysis and biocatalysis communities, containing a balanced mix of fundamental, technology-oriented, experimental and computational original research and reviews, thus appealing to both academic and industrial scientists.

Original research articles published in the journal must show new catalytic discoveries that are a significant advance on previously published work, bringing conceptual advances, or molecular insights to catalytic processes, and where appropriate, demonstrate the relationship between synthesis, structure and performance of catalytic systems. Kinetics and mechanisms are a central part of catalysis science and should be included in submitted articles.

Examples of topics within the journal's scope and the expected significance are:

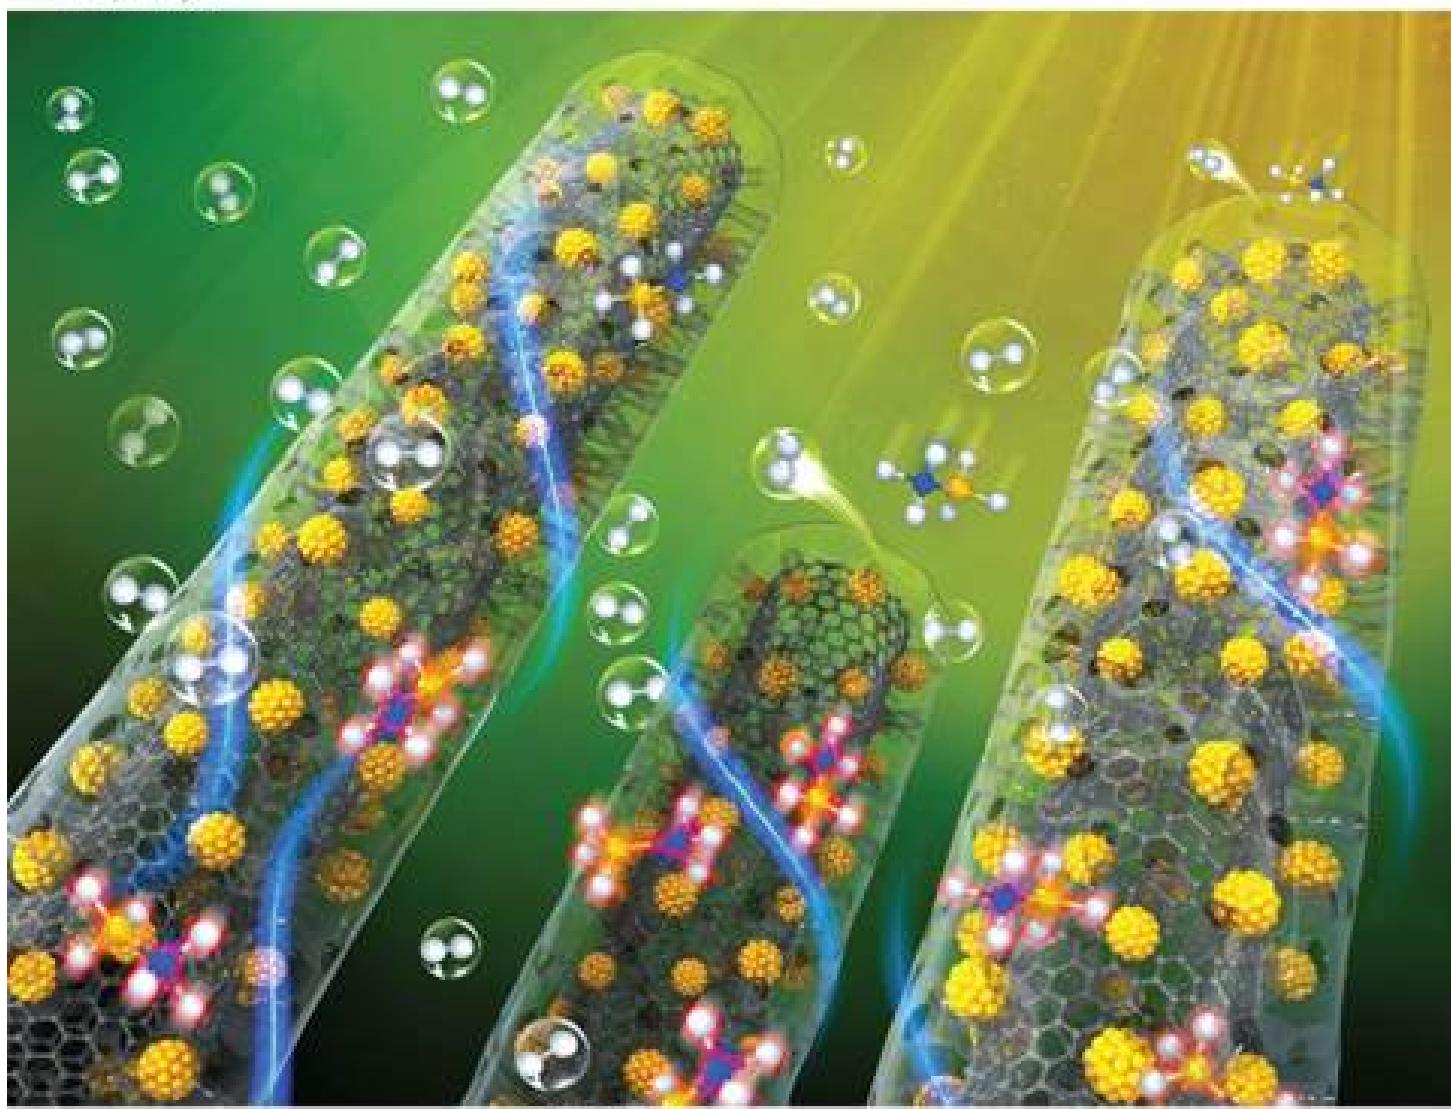

- In-depth mechanistic insights through advanced methods and theoretical methods that are of significant and direct interest and impact in the science and application of catalysts and catalytic processes. Studies using concepts are preferred to trial and error optimisation
- New catalysts and/or processes for conversions of current and future interest within life sciences, pharmaceuticals, polymers, environmental protection, energy and fuels. Studies that report incremental improvement of catalytic performance will not be published in the journal
- New catalytic reactions with significant impact in addressing current challenges and societal demands, for example waste reduction, reduced energy use or efficient use of feedstocks
- Studies that relate chemical reactions at surfaces, reactivity of metal complexes, or macromolecular structure to catalytic function and processes. Studies emphasising sophisticated materials and properties with residual evidence of catalytic function will not be published in the journal
- Theoretical studies of materials and molecules (exhibiting catalytic turnover) that result in significantly greater performance or understanding of existing catalytic reactions
- Studies on multiscale modelling, for example, engineering of catalytic processes from the nano to the macroscale
- Synthesis strategies for inorganic materials, hybrid materials and macromolecules that can be used as catalysts or their supports. Studies that claim catalyst performance must support this with kinetic data and proper mass balances

These criteria will be used by our associate editors and reviewers to assess the significance of each submitted manuscript.

Abstract

Quantum mechanical (QM) and QM/molecular mechanics (MM) calculations of three different cluster models have been performed to shed light on hydrogen bonding networks and proton wires for proton

release pathways (PRP) of water oxidation reactions in the oxygen evolving complex (OEC) of photosystem II (PSII). Positions of all the hydrogen atoms in an extended QM Model III including the second coordination sphere for the active-site CaMn₄O₅ complex of OEC of PSII have been optimized assuming the geometry of heavy atoms determined by the recent high-resolution X-ray diffraction (XRD) experiment of PSII refined to 1.9 Å resolution. Full geometry optimizations of the first coordination sphere model (QM Model I) embedded in the Model III and QM (QM Model I plus seven water molecules, namely QM Model II)/MM models, together with full QM Model III, have also been conducted to elucidate confinement effects for geometrical parameters of the CaMn₄O₅ cluster by proteins. Computational results by these methods have elucidated the O···O(N), O···H distances and O(N)–H···O angles for hydrogen bonds in proton release paths (PRP) I and II that construct a proton wire from Asp61 toward His190. The hydrogen-bonding structures revealed have also been examined in relation to the possibilities of protonation of bridge oxygen dianions within the CaMn₄O₅ cluster. The optimized inter-atomic distances by QM Models I and III, together with QM(Model II)/MM, have elucidated the elongation of the Mn–Mn distances with hydrogen bonds and variations of the Mn_d–O₍₅₎ length with confinement effects by protein. Implications of the computational results are discussed in relation to the available EXAFS experiments, and internal, semi-internal and external reductions of Mn ions and long Mn–Mn distances of the high-resolution (SP8) XRD, and rational design of artificial catalysts for water oxidation that are current topics in the field of OEC of PSII.

Enhancement of visible light photocatalytic performances of Bi₂MoS₂O₄ nanoplates[†]

Rui Shi,^{a,b} Tongguang Xu,^b Lihong Yan,^b Yongfa Zhu^{*a} and Jun Zhou^{*b}

Author affiliations

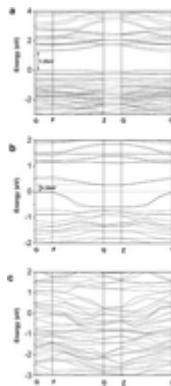

* Corresponding authors

^b Beijing Cigarette Factory, Beijing, China

Abstract

A novel Bi₂MoS₂O₄ nanoplate photocatalyst with high-energy efficiency and high-activity has been successfully synthesized by a reflux method. The visible-light response of Bi₂MoS₂O₄ could extend from 480 to 630 nm compared with Bi₂MoO₆. Compared with Bi₂MoO₆, the photocatalytic activities of the Bi₂MoS₂O₄ sample increased about 0.4 and 4.6 times for degradation of methylene blue (MB) under UV and visible-light ($\lambda > 510$ nm) irradiation, respectively. Density functional calculations revealed that Bi₂MoS₂O₄ had a narrower band gap and wider valence bandwidth compared with Bi₂MoO₆ because S 3p orbitals contributed to the valence band formation. The high energy efficiency of Bi₂MoS₂O₄ photocatalysts came from a narrow bandgap and the high activity came from a wider and dislocated valence band of Bi₂MoS₂O₄. Furthermore, the synthesis of Bi₂MoS₂O₄ could afford guidance for designing the other high-energy efficient and highly active photocatalysts.
