Abstract

View references (42)

An electrodeposited Cu₂ZnSnS₄ (CZTS) compact thin film modified with an In₂S₃/CdS double layer and Pt deposits (Pt/In₂S₃/CdS/CZTS) was used as a photocathode for water splitting of hydrogen production under simulated sunlight (AM 1.5G) radiation. Compared to platinized electrodes based on a bare CZTS film (Pt/CZTS) and a CZTS film modified with a CdS single layer (Pt/CdS/CZTS), the Pt/In₂S₃/CdS/CZTS electrode exhibited a significantly high cathodic photocurrent. Moreover, the coverage of the In₂S₃ layer was found to be effective for stabilization against degradation induced by photocorrosion of the CdS layer. Bias-free water splitting with a power conversion efficiency of 0.28% was achieved by using a simple two-electrode cell consisting of the Pt/In₂S₃/CdS/CZTS photocathode and a BiVO₄ photoanode. © 2015 American Chemical Society.

About the Cover:

The first molecular probe for selective *in vivo* detection of oligomeric amyloid β -peptide ($A\beta$) against monomeric and fully aggregated species is demonstrated. Structural binding model of $A\beta$ oligomer complex with the probe offers the molecular mechanism of the $A\beta$ oligomer selectivity. See Chang and co-workers, p 13503.
