Abstract

A planing hull is a high-speed craft with relatively complex hydrodynamic characteristics. An increase in speed can induce a significant change in trim angle with an increment in ship drag. One solution to reduce ship resistance is to use an interceptor. This research aimed to analyze the hydrodynamics of a planing hull vessel by applying an interceptor. The fundamental aspects reviewed included the analysis of drag, trim, heave, and lift force. The interceptor would be investigated on the basis of its integrated position at its height. This research also used the computational fluid dynamic (CFD) method in calm water conditions. All simulations were conducted with the same mesh structure, which allowed the performance evaluation of the interceptor in calculating turbulent air–water flow around the ship. Numerical calculations used the Reynolds-averaged Navier–Stokes (RANS) equation with the $k-\epsilon$ turbulence model to predict the turbulent flow. The vertical motion of the ship was modeled using dynamic fluid–body interaction (DFBI) in the fluid domain through an overset mesh technique. The numerical approach was compared with the experimental test results of Park et al. to ensure the accuracy of the test results. The interceptor was designed at the transition phase, which showed the highest trim angle followed by high drag. The interceptor could be designed with a trim angle that is high enough to reduce the resistance of the ship.

International scientific peer reviewed open-access on-line journal Theory and Practice of Naval Architecture, Marine Engineering and Ocean Engineering Serving Shipbuilding, Shipping and Offshore Industry Indexed by Web of Sciences (WoS) Science Citation Index Expanded since 2008 2017 Journal Citation Reports® Science Edition (Thomson Reuters, 2017) impact factor 0.519 (5 year 0.574) ranked Q4 11th/14 in category Marine Engineering (View ranking) 2017 SCImago ranking Q2 in Mechanical Engineering and Q2 in Ocean Engineering SJR=0.366 H Index=9, SNIP=0.824 (View ranking) Aims and scopes Journal is devoted to multidisciplinary researches in the fields of theoretical and experimental naval architecture and oceanology as well as to challenging problems in shipping, shipbuilding, offshore and related industries worldwide. The aim of the journal is to integrate interests in shipbuilding, ocean engineering, sea and ocean shipping, inland navigation and intermodal transportation as well as environmental issues, overall safety, wind, marine and hydrokinetic renewable energy production and sustainable transportation development at seas and oceans. The journal focuses on hydrodynamics, structures, reliability, materials, construction, design, optimization, production engineering, building and organization of building, project management, repair and maintenance planning, information systems in shipyards, quality assurance as well as outfitting, powering, power plants and equipment onboard. About journal BRODOGRADNJA(SHIPBUILDING) Journal BRODOGRADNJA(SHIPBUILDING) was launched in 1950 as an expression of growing enthusiasm and ambition for promotion of the shipping and shipbuilding tradition of Croatia. Its primary focus was on research and development serving the fast developing shipbuilding industry. The permanently growing shipbuilding industry took over the publishing of BRODOGRADNJA in 1981. In 1982 BRODOGRADNJA became a bilingual international journal, i.e. contributions were written either in Croatian or English. The Croatian shipbuilding research institute – Brodarski Institute became the publisher of BRODOGRADNJA in 1992. During this successful period of growth, BRODOGRADNJA covered the following regularly scheduled sections: peer reviewed scientific and professional papers, current topics and news from the shipbuilding industry, reviews, and worldwide maritime news. Since the beginning of the year 2014 BRODOGRADNJA has been edited and published by the Faculty of Mechanical Engineering and Naval Architecture of the University of Zagreb. BRODOGRADNJA is intended to be an international scientific peer reviewed open-access journal with focus on the Theory and Practice of Naval Architecture, Marine Engineering and Ocean Engineering serving the Shipbuilding, Shipping and Offshore Industry and related topics. Open access BRODOGRADNJA(SHIPBUILDING) has been adopted the GUIDE FOR THE PREPARATION OF SCIENTIFIC PAPERS FOR PUBLICATIONS PGI-83/WE/10, Second Edition, Paris 1983, United Nations Educational, Scientific and Cultural Organization (UNESCO) General Information Programme and UNISIST. BRODOGRADNJA(SHIPBUILDING) has been an open access journal from its early beginnings. Paper are available free of charge to everyone in accordance with the Budapest Open Access Initiative from 2002 and Croatian declaration on open access to scientific information from the year 2012. Open and fully free access is particularly supported after the inclusion of BRODOGRADNJA into the Central

Savjet Hrčka

Prepoznajući potrebu da urednici, izdavači te šira istraživačka, akademska i stručna javnost aktivno sudjeluju u raspravama i odlučivanju o statusu i smjeru razvoja Hrčka, Srce je 1. travnja 2021. imenovalo četvrti saziv Savjeta Hrčka.

Zadaće i način rada Savjeta definirani su [Pravilnikom hrvatskih znanstvenih i stručnih časopisa - Hrčak](#).

Članovima Savjeta imenovani su:

- doc. dr. sc. Ante Blaće, Sveučilište u Zadru / tehnički urednik časopisa Geoadria
- Iva Grabarić Andonovski, Sveučilište u Zagrebu, Prehrambeno-biotehnološki fakultet / urednica časopis Food Technology and Biotechnology, imenovana predstavnicom Hrvatske udruge za znanstvenu komunikaciju - ZNAK
- dr. sc. Bono Lučić, Institut Ruđer Bošković / urednik časopis Croatica Chemica Acta
- prof. dr. sc. Tomislav Malvić, Sveučilište u Zagrebu, Rudarsko-geološko-naftni fakultet / glavni urednik časopisa Rudarsko-geološko-naftni zbornik
- prof. dr. sc. Daria Pašalić, Sveučilište u Zagrebu, Medicinski fakultet / glavna urednica časopisa Biochemia Medica
- mr. sc. Sonja Pigac, Nacionalna i sveučilišna knjižnica u Zagrebu, imenovana predstavnicom
- Ivana Prosinečki, Ministarstvo znanosti i obrazovanja, Uprava za znanost i tehnologiju – imenovana predstavnicom
- prof. dr.sc. Jasenka Sremac, Sveučilište u Zagrebu, Prirodoslovno-matematički fakultet
- izv. prof. dr. sc. Jadranka Stojanovski, OpenAIRE NOAD.

Predsjednicom Savjeta imenovana je prof. dr. sc. Daria Pašalić.

Mandat članova Savjeta traje dvije godine od dana imenovanja.

A planing hull is a high-speed craft with relatively complex hydrodynamic characteristics. An increase in speed can induce a significant change in trim angle with an increment in ship drag. One solution to reduce ship resistance is to use an interceptor. This research aimed to analyze the hydrodynamics of a planing hull vessel by applying an interceptor. The fundamental aspects reviewed included the analysis of drag, trim, heave, and lift force. The interceptor would be investigated on the basis of its integrated position at its height. This research also used the computational fluid dynamic (CFD) method in calm water conditions. All simulations were conducted with the same mesh structure, which allowed the performance evaluation of the interceptor in calculating turbulent air–water flow around the ship. Numerical calculations used the Reynolds-averaged Navier–Stokes (RANS) equation with the $k-\epsilon$ turbulence model to predict the turbulent flow. The vertical motion of the ship was modeled using dynamic fluid–body interaction (DFBI) in the fluid domain through an overset mesh technique. The numerical approach was compared with the experimental test results of Park et al. to ensure the accuracy of the test results. The interceptor was designed at the transition phase, which showed the highest trim angle followed by high drag. The interceptor would experience negative trim at high speeds; thus, it was not recommended. The research results indicated that the most effective use of the interceptor was at Froude number 0.87 close to the chine position with a height of 100%. This interceptor could reduce a maximum of 57% drag, 17% heave, 8.48% trim, and 0.12% lift force. The interceptor could increase excessive drag and trim at Froude numbers over 1.16. The interceptor proved to be remarkably useful in trim control and ship drag reduction, but selecting the wrong dimensions and positions of the interceptor could endanger the ship. This simulation was performed on Aragon-2; thus, the interceptor performance may possibly change if a different hull geometry is used.

Sažetak

Deepwater subsea wellheads may be significantly threatened under extreme sea conditions and operations, especially when the seabed is composed of very soft clay properties. A numerical model of a deepwater wellhead system is established using the classic ocean pipe element and nonlinear spring element of ANSYS to examine the behaviors of subsea wellheads in diverse seabed soil. Nonlinear spring elements coded in the APDL language are used to model three types of seabed soils: very soft soil, soft soil, and firm soil. The dynamic and quasi-static behaviors of the wellhead system in the typical coupled and decoupled models of the drilling riser system are particularly investigated in depth. The effects of the nonlinear seabed soil properties on the detailed wellhead are realistically simulated using time domain and extremum analysis. The results show that the softer the seabed soil, the greater the displacement, rotation angle, curvature, and bending moment of deepwater subsea wellheads. When the seabed soil reaches a particular depth, the mechanical characteristics of the wellheads under the three types of seabed soil conditions are almost simultaneously close to zero. Overall, several conclusions reached in this study may provide some useful references for design and stability analysis.

Abstract

This paper presents an unmanned surface vehicle Tritor that was developed, constructed, and tested within an innovative, multi-purpose, multidisciplinary, low-budget and environmentally friendly solution. The idea behind this work was trying to invent a new concept of a miniature surface vehicle that will be unmanned, remotely controlled and autonomous, with electric propulsion, and with an innovative Three Slender Cylinders Hull (3SCH) form gaining advantages in comparison to existing surface vehicles. This initial work is focused on vehicle prototype design, propulsion system development and optimization, control design, and trials, while research related to advantages of the vehicle in terms of naval architecture criteria such as drag and power, stability, seakeeping, and maneuverability will be investigated in further work. In addition, the paper intends to contribute to a new trend in developing vehicles with electrical propulsion that could use renewable sources of energy such as wind and solar energy. The potential usage of the vehicle can be civilian or military, and further work will be focused on larger models, improved based on the experience got during the development of the vehicle. Tritor vehicle was successfully designed, constructed, and tested in real environmental conditions. The preliminary results show that the vehicle has required performances and potential for improvements in the future. The main scientific contribution of this work is advanced surface vehicle development with a focus on a new hull form and the integration of electric propulsion in it.
